Subject: ARM-4073 Wiring Configuration

The ARM-4073 Automatic Re-pressurization Module can be wired for 115VAC or 230VAC power supply. The two different wiring configurations are shown on page six of the installation manual. In addition to a different wiring configuration, the unit has shunt jumpers which must be modified in order to configure the unit for 230VAC (all units are shipped from the factory configured for 115VAC). Page one of the installation instructions describes the necessary modification. Photos of the two different configurations are below.

115 VAC

230 VAC
